AI in a nutshell

Traditional Approach vs. Machine Learning Approach

Traditional Programming: you code the behavior of the program

Machine Learning: you leave a lot of that to the machine to learn from data

GENERAL FLOW

Traditional Approach

data

x	y
1	2
2	4
3	6
4	8
5	10
6	12
7	14

$$y = 2x$$

Mudah melihat fungsinya (rule)!

Coba Tebak Fungsi/Rule-nya...!

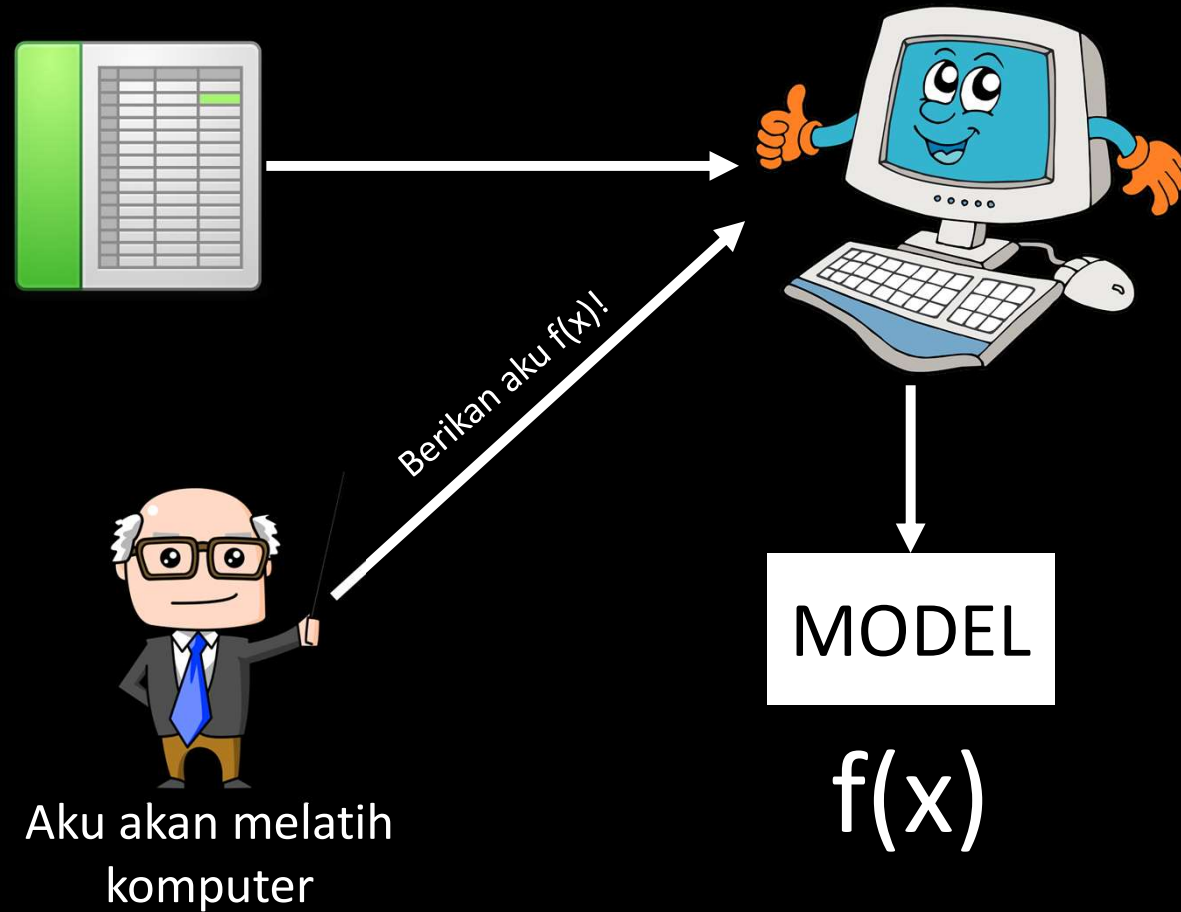

x	y
1	1
2	4
3	9
4	16
5	25
6	36
7	49

$$y = \square$$

x	y
1	3
2	7
3	13
4	21
5	31
6	43
7	57

$$y = \square$$

Machine Learning Approach

GOAL?

Aku sudah terlatih dan pintar!

Jadi, apa yang bisa kubantu?

Ya, aku bisa **memprediksi** “sesuatu”
Dari data di masa depan yang belum pernah kulihat

Perlu diingat!

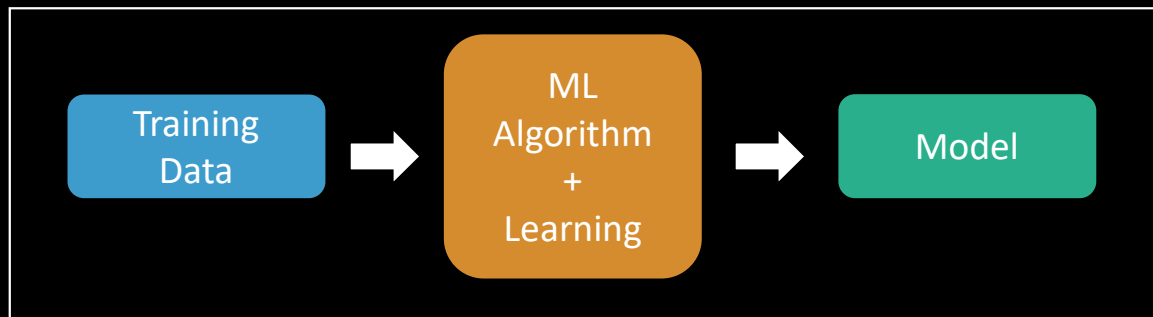

Prediksiku hanya **estimasi**, bisa saja salah 😊

Machine Learning Definition

“Machine learning is a branch of artificial intelligence that enables computers to **learn from data** and **improve their performance over time** without being explicitly programmed.” (Arthur Samuel)

Workflow

Training

Testing

Workflow (cont'd)

Training

Testing

Jenis-jenis learning

Supervised Learning

Model dilatih dengan data yang **diberi label** sesuai keluaran yang sebenarnya.

Unsupervised Learning

Model dilatih dengan data yang **tidak terlabel**. Model diharapkan mencari pola tersembunyi.

Reinforcement Learning

Model dilatih pada lingkungan tertentu dengan **trial and error**. Biasanya dengan proses reward and punishment.

Intuition Behind Learning

Parameters

Internal variables or settings of a model that determine its behavior and ability to make predictions. **Parameters are learned** or adjusted during the training phase of the model.

Loss function

Also known as cost function or objective function, is a mathematical function that **measures the difference** between the predicted output of a machine learning model and the actual output.

Optimization

Process of finding the best set of **parameters** or weights for a model that **minimizes** a given **loss function**.

Training data: $\{(x_i, y_i)\}_{i=1}^n$

$$f(x) = ax + b$$

Temukan a dan b terbaik, sehingga $f(x_i) \approx y_i$

Let's play..

Training data: $\{(x_i, y_i)\}_{i=1}^n$

$f(x) = ax + b$ Temukan a terbaik, sehingga $f(x_i) \approx y_i$

1. Pilih sebuah Loss Function:

$$L(a) = \frac{1}{n} \sum_i (y_i - f(x_i))^2$$

MSE (Mean Squared Error)

$$L(a) = \frac{1}{n} \sum_i (y_i - ax_i)^2$$

Let's play.. (cont'd)

1. Pilih sebuah Loss Function:

MSE (Mean Squared Error)

$$L(a) = \frac{1}{n} \sum_i (y_i - ax_i)^2$$

$$f(x) = ax$$

2. Tentukan tujuan (objective)

minimize $L(a)$

Let's play.. (cont'd)

2. Tentukan tujuan (objective)

minimize $L(a)$

3. Buat aturan untuk update nilai a

$$a_{baru} \leftarrow a_{lama} - \eta \frac{dL(a)}{da}$$

η = learning rate

3. Berhenti jika telah mencapai convergence

$$f(x) = a_{baru}x$$

We have a new model!!

Summary

We have dataset

$$\{(x_i, y_i)\}_{i=1}^n$$

We have a model

$$f(x) = ax$$

Calculate the loss

$$L(a) = \frac{1}{n} \sum_i (y_i - ax_i)^2$$

Update parameter(s)
(optimization/minimization)

$$a_{baru} \leftarrow a_{lama} - \eta \frac{dL(a)}{da}$$

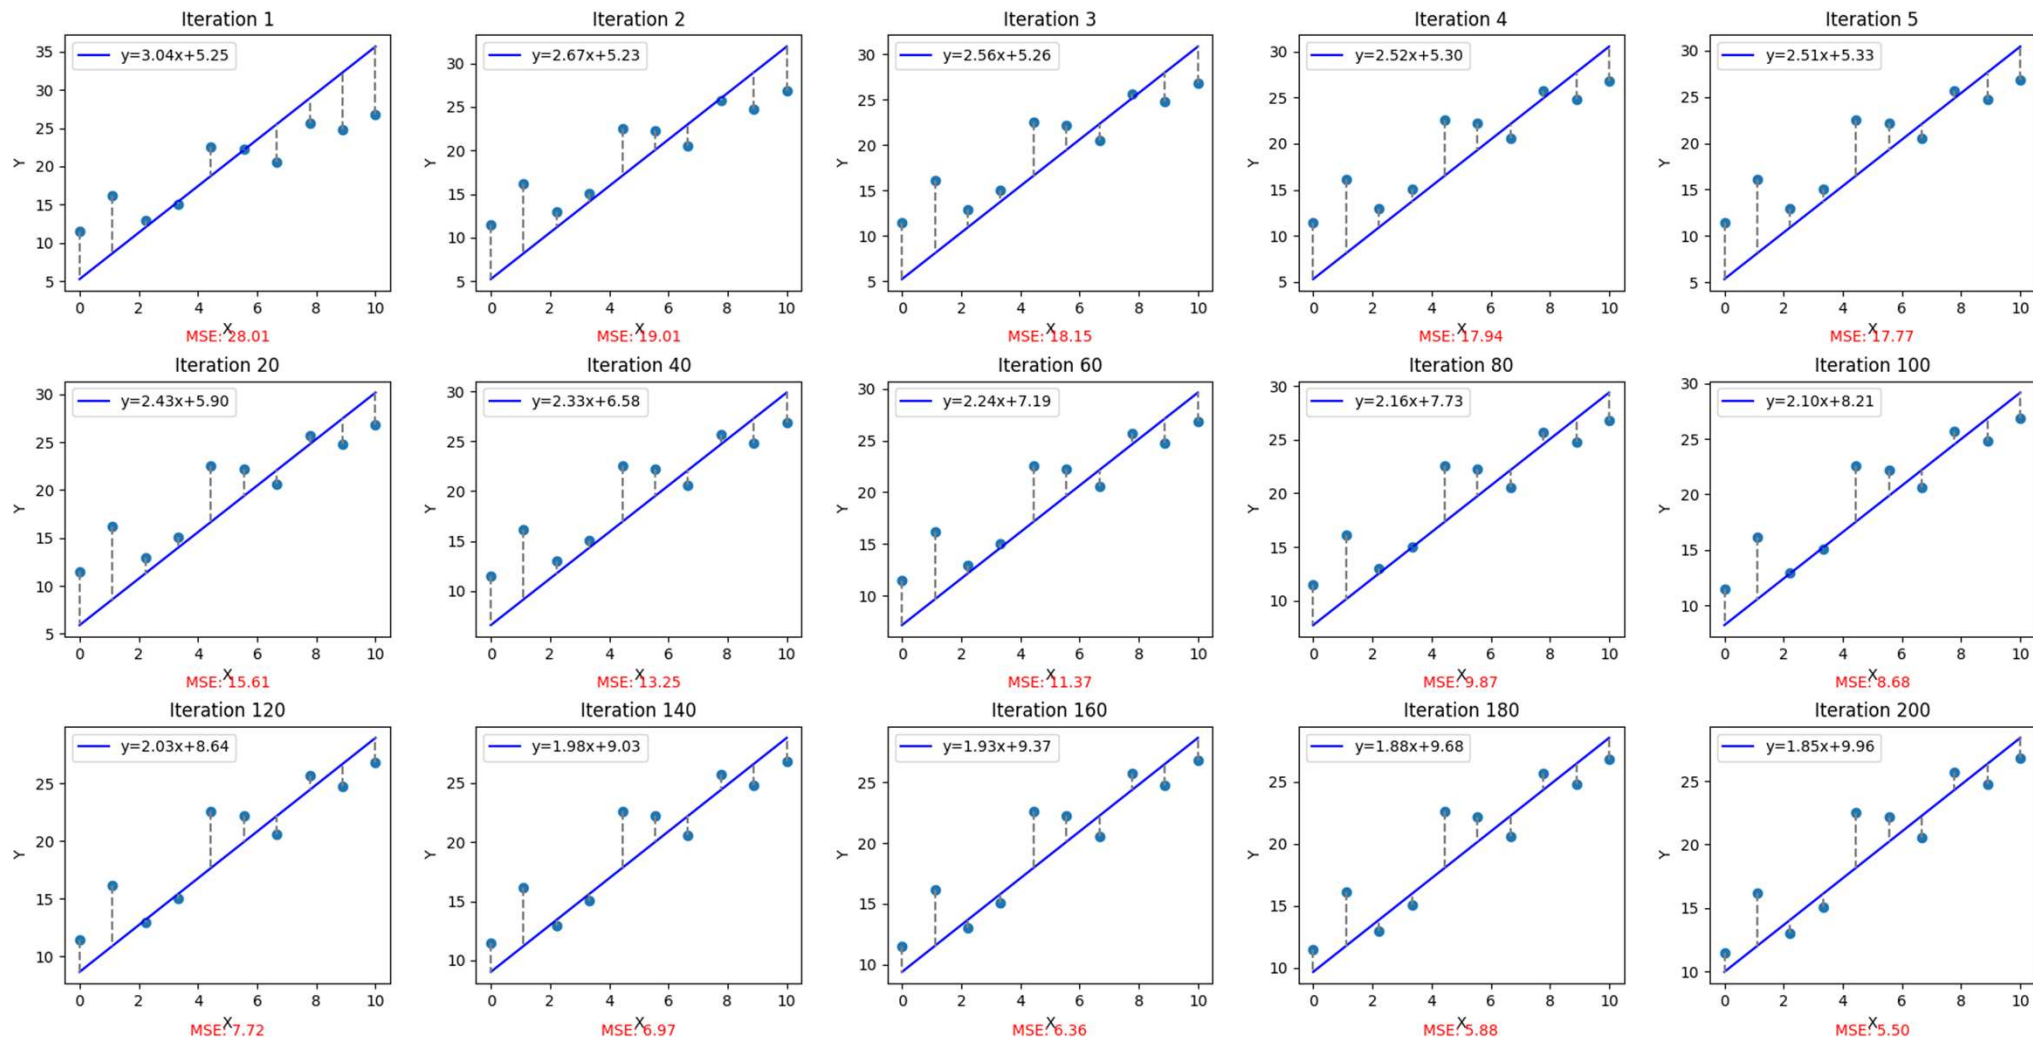

Stop(?)

Yes

$$f(x) = a_{baru}x$$

No
